

ECT Virtual PBX: Rich and Fertile

The ECT Virtual PBX application allows carriers and service providers to replace enterprise PBX equipment with a service provided in their network.

Small and medium-sized businesses avoid a superfluous combination of fixed, cordless, and mobile telephones. Instead, each employee has just one mobile phone, one phone number, one voicemail and one phone book. Calls to other employees within the company are processed as internal calls. All the classical features of a fixed-line telephone system, such as a switchboard, call forwarding, conferencing, hunting groups, call pickup groups, executive-secretary groups, etc. are available in the network and can be configured via an easy-to-use web portal in the Internet. Each employee can use one standard mobile telephone for all his/her communications needs - without having to give up the features of a fixed-line telephone system: you use one and the same mobile with complete freedom of movement within and outside of the office.

More information will be made available shortly on: www.ect-virtualpbx.com, until then, [please contact us](#) to receive more details about our product offering.
